1. Determine (with justification) whether the following statements are true or false:

Every continuous function f on $[a, b]$ can be uniformly approximated by a sequence of even polynomials.

Answer: The statement is true since even polynomials form an algebra. We can see this as follows: if p and q are 2 even polynomials then,

Hence even polynomials on $[a, b]$ form an algebra

Since even polynomials contain the constant function (the polynomial 1) and separate points on $[a, b]$ (for any x, y , the polynomial x^2 is even and separates x and y), by the **Stone-Weierstrass theorem**, the set of even polynomials is dense in $C([a, b])$. Thus, every continuous function on $[a, b]$ can be uniformly approximated by a sequence of even polynomials.

Every continuous function f on $[a, b]$ can be uniformly approximated by a sequence of odd polynomials.

Answer: This statement is also true. If f is any continuous function, we can consider a function $g(x) = f(x) - f(a)$. Now this is also continuous since f is in $C([a, b])$. Hence by ϵ - δ we have that g can be uniformly approximated by a sequence of even polynomials p_n . Now consider the sequence of odd polynomials $q_n(x) = p_n(x) - p_n(a)$ where $p_n(a) = f(a)$ such that, for

Every continuous function f on $[a, b]$ can be uniformly approximated by a sequence of even polynomials.

Answer: This statement is also true. The same argument as in ϵ - δ goes through.

Every continuous function f can be uniformly approximated by a sequence of odd polynomials.

Answer: This statement is false since all odd polynomials need to be 0 at $x = 0$. Hence any sequence of odd polynomials should converge pointwise at $x = 0$ to i.e. 0. So continuous functions with $f(0) \neq 0$ cannot be uniformly approximated.

2. Fix some function f . Define a sequence of functions f_n by $f_n(x) = f(x/n)$. If $\{f_n\}$ forms an equicontinuous family then show that f is constant.

Answer: By assumption of equicontinuity we have, δ such that,

Since δ such that $|x - y| < \delta \implies |f(x) - f(y)| < \epsilon$. So we get for x, y ,

Here δ is arbitrary so we have that,

and since ϵ is also arbitrary, we have $f(x) = f(y)$. Hence f is a constant function.

3. Let $\{f_n\}$ be a sequence of continuous functions such that

Define a sequence of functions g_n by $g_n(x) = f_n(x/n)$.

Show that $\{g_n\}$ has a subsequence that converges uniformly on $[0, 1]$.

Answer: We have that

We see that for any x we have $|g_n(x)| \leq M$ such that for x we have $|g_n(x) - g_m(x)| \leq \epsilon$, for all n, m . Hence $\{g_n\}$ is uniformly equicontinuous. Now,

Hence $\{g_n\}$ is uniformly bounded, and $[0, 1]$ is compact. So by **Arzela-Ascoli theorem** we have that $\{g_n\}$ has a convergent subsequence which converges uniformly on $[0, 1]$.

4. Let f be a continuously differentiable function on $[0, 1]$. Show that there is a sequence of polynomials p_n such that

Answer: We have that f is continuous on $[0, 1]$ so by **Weierstrass approximation theorem** we have that p_n such that $p_n \rightarrow f$ uniformly. Now define,

We see that since $p_n \rightarrow f$ uniformly implies, $|p_n(x) - p_m(x)| \leq \epsilon$ for all x and n, m . Hence for x we have,

Hence we have that p_n converges uniformly to f . Also we have by construction of that p_n is a polynomial. So by **Fundamental theorem of calculus** we have,

5. Give an example (with justification) of a continuous function f which cannot be approximated by any sequence of polynomials on $[0, 1]$.

Answer: Every non-constant polynomial is unbounded. Hence if we choose any non-constant bounded continuous function we have ϵ such that

Hence we have that f is bounded for x , i.e. f is constant for x . Hence it can only converge to a constant function. So any non-constant bounded continuous function cannot be approximated by polynomials on $\mathbb{R}$. For example, $f(x) = \sin(x)$ is a continuous bounded function which cannot be approximated by polynomials on $\mathbb{R}$.
